

ABSTRACT

A multifunctional ladle includes a spoon-body which has a handle and a perforated spoon which mounts on the spoon-body by using a link rod, a spring and a screw. By pushing or pulling a switch on the handle which connects with the link rod, the perforated spoon can be detached from the spoon-body and in that case the multifunctional ladle can be used as a strainer, or the perforated spoon can be combined with the spoon-body and in that case the multifunctional ladle can be used as a spoon.
